

Standards-Aligned CaveSim Programs for South Dakota Elementary Schools

Prepared by Dave Jackson, CaveSim creator and lead educator. Contact

Dave: dave@cavesim.com

Right: Awestruck at a program in Los Alamos, NM, 2017

Teacher quotes:

“Science Days was a rousing success and everyone is raving about how good your stations were. The cave, obviously, but I have also heard especially good things about the bats and echolocation games being perfect for the younger kids and I saw the bigger ones enjoying it as well. I’ve had a number of teachers say they want you back.” — **Julie Haverluk, Academy International Elementary School, Colorado Springs**

“CaveSim was amazing. I had students come up to me the next day, give me a big hug and say ‘Thank you Ms. Jones for having the cave at our school. It was so fun.’ The students were able to understand cave formations, organisms and cave safety. You and the other cave experts were fantastic. You were able to share important content related to earth science and life science. Each part of the presentation was aligned to our science standards. They particularly loved climbing through the cave and the ‘tower’. Mike was great. Thanks for all that you do. We would love to see you back next year.” — **Patricia Jones, teacher, Houston Elementary, Austin ISD**

Summary

Thank you for your interest in CaveSim! The centerpiece of our programs is our mobile CaveSim system, which we'll bring to your school in a 26' trailer. The cave is filled with formations, critters, and ancient artifacts (all artificial), and students get a computerized score based on how carefully they avoid these objects as they explore. We'll also bring you an entire program of SD DOE Standards¹-aligned hands-on lessons/activities with the mobile cave. Our elementary program meets the latest South Dakota standards, and covers many subjects including science, math, engineering, PE and art.

Programs are led by CaveSim inventor, educator, and MIT-trained engineer Dave Jackson. Dave and his wife Tracy are both cavers, and have been doing CaveSim since 2010 for over 70,000 students. Our lessons are designed by Tracy, who has a Masters of Teaching from Colorado College, and brought to you by Dave and other highly skilled CaveSim staff.

In addition to learning a wide range of classroom subjects, students also learn that they can do what Dave and Tracy have done: take what they've learned in school and use it to follow their passions to make the world just a little bit better. We look forward to bringing CaveSim to your school to engage your students in a whole new way, and we're excited about working with you.

Standards Alignment and Program Details

Standard components are included in the cost of the program. Programs are typically conducted by having students work with us at a series of different stations/lessons, as follows:

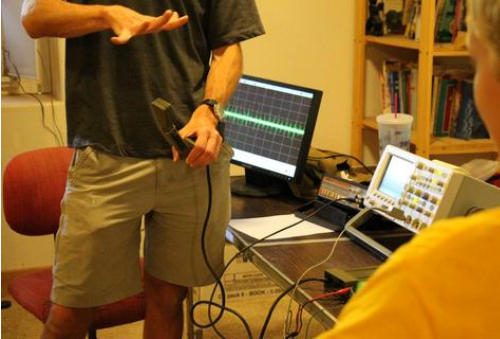

CaveSim program element: Horizontal Cave Exploration	Corresponding SD DOE Standards	Photos of past CaveSim programs
<p>In CaveSim mobile cave (60' of passage with multiple levels in a 24' trailer), students explore in small groups (while wearing helmets with headlamps) and:</p>	<p>Science 1-PS4-2 Construct an evidence-based account for how objects can be seen only when illuminated.</p>	
<ul style="list-style-type: none"> Try to avoid bumping into artificial cave formations. Students learn that oil & water do not mix, & that touching formations can cover them with skin oil, which stops formations from growing. Students learn that cave formations take a long time to form. 	<p>Science 2-ESS1-1 Use information from several sources to provide evidence that Earth events can occur quickly or slowly.</p>	
<ul style="list-style-type: none"> Look for cave biota (critters, all artificial), and discuss the cave ecosystem after they exit the cave. CaveSim staff teaches about the cave food web, including the amazing lampshade spider, which eats fungus gnats, which eat fungus, which eat deceased bats, etc. 	<p>Science 5-LS2-1 Develop a model to describe the movement of matter and energy among producers, consumers, decomposers, and the environment.</p>	
<ul style="list-style-type: none"> Learn about how cave passage forms. Staff teach about bacteria that use enzymes to eat limestone (breaking chemical bonds to get energy). We can also discuss the formation of sinkholes, and the benefits / dangers that they afford humans. Demo available upon request: dissolution of carbonate rocks using weak acid. Discussion of how humans use cave-based resources (e.g., limestone, guano) 	<p>Science 3-LS4-3 Construct an argument with evidence [showing] how some organisms thrive, some struggle to survive, and some cannot survive in a particular habitat.</p> <p>Science 5-LS2-1 Develop a model to describe the movement of matter and energy among producers, consumers, decomposers, and the environment.</p>	
<ul style="list-style-type: none"> CaveSim staff explain how aqueous cave formations (helictites, soda straws, gypsum) form. Topics covered: water flow is usually downhill due to gravity; sometimes water flows against gravity due to capillary action (examples: water climbing up a towel, water flow inside cave formations); water is capable of mechanically weathering limestone to produce caves, and water with acidic pH is capable of chemically weathering limestone to produce caves. Students expand vocabulary with "capillary action." 	<p>Science 4-ESS2-1 Make observations and/or measurements to provide evidence of the effects of weathering or the rate of erosion by water, ice, wind, or vegetation.</p>	
<ul style="list-style-type: none"> Look for modern equipment in the cave, including rescue cache and vertical caving rope ladder (etrier). Students learn that the etrier (rope ladder) is named after the French word for stirrup. Students expand vocabulary with the word "cache," which is a homophone 	<p>3.RF.4 Read with sufficient accuracy and fluency to support comprehension. c. Use context to confirm or self-correct word recognition and understanding, rereading as necessary.</p>	
<ul style="list-style-type: none"> Look for artifacts and rock art. Discuss the importance of artifacts to native people and to archaeologists and anthropologists. Hear a real story about a CaveSim staff member's experience with artifacts while exploring caves in Mexico. Students discuss why we don't take native artifacts or damage native art. Differences between graffiti and art are discussed. 	<p>Fine Art 1.VA.Cn.11.1 Understand that people from different places and times have made artwork for a variety of reasons.</p> <p>Fine Art K.VA.Re.7.1 Identify and describe uses of art.</p>	
<ul style="list-style-type: none"> Available upon request: prior to entering the cave, students are asked to make cave paintings with black paint on butcher paper. Students are encouraged to reflect on their paintings and write a few sentences about what story their picture tells. During exploration of the mobile cave, students are given extra time in the cave to make sketches of the cave paintings that they find. After they exit the cave, students are given time to write a few sentences on their sketch to tell a story about what they saw in the cave paintings. As a group, students are invited to share the stories that they wrote. 	<p>Fine Art K.VA.Re.8.1 Describe what an artwork represents.</p>	
<p>Space required: the 24' trailer is typically kept outside. See www.cavesim.com/site-logistics for more details. In inclement weather, we may close the trailer and do indoor activities.</p>		

Thrilled to explore CaveSim in Glenwood Springs, CO, 2018. Photo by Chelsea Self, Post Independent.

Elementary students in Cascade, CO explore the mobile cave.

CaveSim program element: Vertical Caving	Corresponding SD DOE Standards	Photos of past CaveSim programs
<p>On CaveSim portable 12' A-frame w/ crash pads:</p> <ul style="list-style-type: none"> While wearing helmets, students use a Bosun's chair, ropes, and pulleys to learn about mechanical advantage afforded by 1:1 and 5:1 pulley systems, and learn that work is unchanged when a mechanical advantage is introduced. Students work together to lift a fellow student up the tower using the different systems. Students use their understanding of fractions to determine that the 5:1 pulley system reduces the required lifting force by a factor of 5. In the pulley experiments, CaveSim staff emphasize the importance of changing just one variable at a time. Students learn about balanced and unbalanced forces by lifting a fellow student, and by lifting themselves in the Bosun's chair. <hr/> <ul style="list-style-type: none"> CaveSim staff use harnesses and mechanical ascenders to ascend the A-frame. CaveSim staff discuss the ascender mechanics, as well as equipment safety and the important differences between caving and rock climbing equipment. Students learn the words "ascend," "descend," "vertical", and "horizontal." CaveSim staff demonstrate the role that gravity plays in both the ascending and descending processes (making ascending more difficult for the explorer). Students learn about current events in vertical caving, including ongoing efforts in Mexico to find the world's deepest cave. Students learn that some of the cavers who help with CaveSim have been over 6000' underground. <hr/> <ul style="list-style-type: none"> With the help of students, CaveSim staff demonstrate the power of friction to rapidly destroy Nylon rope. Before the demonstration, students are encouraged to develop hypotheses about what will happen when two ropes are rubbed together, and then develop hypotheses about which rope will break first. After the two ropes are rubbed together rapidly and the larger rope breaks, students are encouraged to try to figure out why the larger rope broke. CaveSim staff explain the outcome by introducing the concept of "concentrated" (because of the way the experiment is done, the heat is <i>concentrated</i> in just one spot on the larger rope, and spread out on the smaller rope, hence the melting of the larger rope). Staff also demonstrate that metal rappel racks do not get damaged in the same way as the Nylon rope. 	<p>Science 3-PS2-1 Plan and carry out an investigation to provide evidence of the effects of balanced and unbalanced forces on the motion of an object.</p> <p>Science 3-PS2-2 Make observations and/or measurements of an object's motion to provide evidence for how a pattern can be used to predict future motion.</p> <p>Science K-PS2-1 Plan and carry out an investigation to compare the effects of different strengths or different directions of pushes and pulls on the motion of an object.</p> <p>Science K-PS2-2 Analyze data to determine if a design solution works as intended to change the speed or direction of an object with a push or a pull.</p> <p>Math 5.NF.B. Apply and extend previous understandings of multiplication and division to multiply and divide fractions. 6. Solve real world problems involving multiplication of fractions and mixed numbers</p> <p>Science 5-PS2-1 Support an argument that the gravitational force exerted by Earth on objects is directed down.</p> <hr/> <p>Science 2-PS1-2 Analyze data obtained from testing different materials to determine which materials have the properties that are best suited for an intended purpose.</p> <p>Science 2-PS1-4 Construct an argument using reasoning and evidence that some changes caused by heating or cooling can be reversed and some cannot.</p>	 <p><i>Above, a student uses mechanical advantage to lift herself up the A-frame.</i></p>  <p><i>Below, students in Montana work together under direct supervision from staff to lift a fellow student .</i></p>
<p><u>Space required:</u> typically outdoors on flat ground. May also be placed indoors where ceiling height is >12'6". Footprint is 8' x 9'.</p>		

CaveSim program element: Carbide Demonstrations	Corresponding SD DOE Standards	Photos of past CaveSim programs
<p>To illustrate chemistry and physics concepts, CaveSim staff bring working carbide lamps and carbide to programs. Demonstrations can include:</p> <ul style="list-style-type: none"> CaveSim staff light a working carbide lamp by placing carbide and water in the lamp to produce a small (and safe) quantity of flammable gas. The resultant gas (acetylene) burns to produce light and heat, but the lamp body also becomes warm because of the exothermic reaction between the carbide and water. Students can touch the lamp body to get a better understanding of the concept of an exothermic reaction. Students also learn about pressure as they see the intensity of the flame drop as the pressure in the lamp drops over time. Older students gain an understanding of the concept of reflectors by observing the behavior of the reflector on the lamps. New vocabulary explained by CaveSim staff: "exothermic," with connection drawn to "exoskeleton." 	<p>Science 5-PS1-1 Develop a model to describe that matter is made of particles too small to be seen.</p> <p>Science 4-PS4-2 Develop a model to describe how light reflecting from objects and entering the eye allows objects to be seen.</p>	
<ul style="list-style-type: none"> CaveSim staff use a specially-designed carbide lamp to demonstrate conservation of matter. The lamp is sealed, allowing staff to mix carbide and water without the resultant acetylene gas escaping. Staff use a digital scale to demonstrate that matter is conserved despite the chemical reaction. 	<p>Science 5-PS1-2 Measure and graph quantities to provide evidence that regardless of the type of change that occurs when heating, cooling, or mixing substances, the total weight of matter is conserved.</p>	<p>Above, carbide lamp demonstration by CaveSim staff.</p>
<ul style="list-style-type: none"> CaveSim staff place carbide and ice in an open pan. As the ice melts, the water reacts with the carbide, producing the aforementioned acetylene gas. CaveSim staff discuss states of matter (solid ice turns to liquid water as it's heated by the carbide, and then to vapor as it boils). For older students, the concept of limiting reactants is introduced. By watching the exciting reaction occur, students gain a more intuitive understanding of the concept of a chemical reaction. New vocabulary taught by CaveSim staff: "reaction", "reactant." 	<p>Science 5-PS1-4 Conduct an investigation to determine whether the mixing of two or more substances results in new substances.</p>	<p>Below, a stock photo of the lamps we use.</p>
<ul style="list-style-type: none"> Science experiment safety is emphasized (e.g., firmly close containers when not in use). Fire safety is emphasized, with an emphasis on who is allowed to make a fire (a responsible adult), what must be present (a method of extinguishing the fire), where the fire should be made (in a safe container away from other fuel sources). <p><u>Space required:</u> typically conducted outdoors, but cannot be done in the rain. May be done indoors in an appropriate lab setting where a small quantity of smoke may be safely produced without setting off alarms or creating hazardous conditions. The smoke produced in this activity is equivalent to the smoke produced by extinguishing about a dozen birthday candles.</p>		

CaveSim program element: Cave Rescue Phones	Corresponding SD DOE Standards	Photos of past CaveSim programs
<p>Hands-on lessons about basic circuits using a pair of wired cave rescue phones. Activities include:</p> <ul style="list-style-type: none"> We bring two cave rescue phones to our programs. The phones are connected by wire, which allows us to discuss basic circuits, and demonstrate that a circuit requires at least one complete loop to function. Students can disconnect and reconnect wires for hands-on learning about conductors and insulators. Students talk with each other over the phones. CaveSim staff discuss the relationship between wire length, electrical resistance, electrical energy dissipation in the wire, and phone volume. Electrical circuits involving the earth as one of the conductors are discussed, as are the role of magnets in the functioning of the phones. CaveSim staff use waterproof speakers, waveform generators, and oscilloscopes to demonstrate that sound is a form of mechanical energy, and that sound waves can produce standing waves in a container of water. Available upon request: Demonstrations with an oscilloscope (see https://whatis.techtarget.com/definition/oscilloscope) by CaveSim owner Dave Jackson, who has designed high speed computer chips for oscilloscopes. The oscilloscope produces a graphical representation of voltage on the cave rescue phone wire vs. time, which allows students to visualize their vocal energy on a screen. We discuss graph axes, and the relationship between time-based and frequency based graphs. Resonances/oscillation of electrical and sound signals are also discussed. This activity is typically done for middle/high school, but can be adapted to older elementary students. 	<p>Science 4-PS4-1 Develop a model of waves to describe patterns in terms of amplitude and wavelength and to provide evidence that waves can cause objects to move.</p> <p>Science 3-PS2-3 Ask questions about cause and effect relationships of electric or magnetic interactions between two objects not in contact with each other</p> <p>Science 4-PS3-4 Design, test, and refine a device that converts energy from one form to another.</p> <p>Science 1-PS4-1 Plan and carry out an investigation to provide evidence that vibrating materials can make sound and that sound can make materials vibrate</p> <p>Science 4-PS4-3 Create and compare multiple solutions that use patterns to transfer information.</p>	 <p><i>Two friends enjoy talking on the cave rescue phones during a 2013 CaveSim program.</i></p>  <p><i>A CaveSim staff person teaches students about electricity and magnetism using cave rescue telephones and electronic test equipment (oscilloscopes).</i></p>
<p><u>Space required:</u> typically outdoors for convenience, but can also be done in any classroom or indoor setting. Oscilloscope demo must be done indoors if it is raining. The oscilloscope has a VGA output, which can be projected to a smartboard, projector, or computer monitor for better viewing by students.</p>		

CaveSim program element: Bat games and lessons	Corresponding SD DOE Standards	Photos of past CaveSim programs
<p>Bat skeleton and guano demonstrations and lessons:</p> <ul style="list-style-type: none"> • Discussion of similarities and differences between bat wing structure and human hands. Discussion of the similarities and differences between various bat species, including bats found in South Dakota. • Demonstration of bat tail structure and usage of the tail in steering, balance, and in catching insects. Discussion about the different tail structures of different species of bats. • Discussion of different types/sizes of bats, and the role that they play in helping humans. Real-life lesson about bat eradication by farmers and the impact on their crops. • Photographic and/or video demonstration of the ongoing White Nose Syndrome (WNS) epidemic that has killed nearly 6 million bats in the last ~10 years. For older grades, lessons about the WNS fungus (<i>Pseudogymnoascus destructans</i>) and how it eats (metabolizes) bats alive. • Discussions about history and the role that caves played in the civil war (as sources of saltpeter for the production of gunpowder). <p><u>Space required:</u> typically done by the trailer to engage students as they wait to explore. Can also be done anywhere inside.</p>	<p>Science 4-LS1-1 Construct an argument that plants and animals have internal and external structures that function to support survival, growth, behavior, and reproduction.</p> <p>Science 4-ESS3-1 Obtain and combine information to describe that energy and fuels are derived from natural resources and their uses affect the environment.</p> <p>Science 3-LS1-1 Develop models to describe that organisms have unique and diverse life cycles but all have in common birth, growth, reproduction, and death.</p> <p>Science 3-LS2-1 Construct an argument that some animals form groups that help members survive.</p> <p>Science 3-LS3-1 Analyze and interpret data to provide evidence that plants and animals have traits inherited from parents and that variations of these traits exist in a group of similar organisms.</p> <p>Science 3-LS3-2 Use evidence and reasoning to support the explanation that traits can be influenced by the environment</p>	 <p><i>CaveSim program lead Dave Jackson teaches kids about bat biology in Glenwood Springs, CO. Photo by Chelsea Self, Post Independent.</i></p>
<p>Bat echolocation game #1: Two at a time, students take turns roleplaying a bat and a moth. The bat (blindfolded) tries to locate and tag the moth using only the “bats” voice and their hearing. The other students form a circle to contain the two students playing the bat and moth. Students learn about echolocation (including the root of the word), and about the reasons that bats must consume so many insects (e.g., high metabolic rate). Students also gain personal confidence.</p> <p><u>Space required:</u> may be played indoors or outdoors. If outdoors, a safe surface must be used (to allow a blindfolded student to move in a small circle of other students without tripping on uneven ground).</p>	<p>Science 5-PS3-1 Use models to describe that energy in animals’ food (used for body repair, growth, motion, and to maintain body warmth) was once energy from the sun.</p>	
<p>Bat echolocation game #2: Students work individually to use sound to navigate their environment. Students are asked to close their eyes and move slowly toward a wall while making a “Shhh” sound. Students are asked to stop when they detect a change in the sound that they hear, and a discussion about how bats and humans process sound differently follows the exercise.</p>	<p>Science 4-LS1-2 Use a model to describe that animals receive different types of information through their senses, process the information in their brain, and respond to the information in different ways.</p>	
<p>Bat Migration Challenge game: Working individually or in groups (depending on grade level), students act out the lives of bats as they encounter daily challenges and opportunities. Students learn about the ways in which humans can act to help or harm bats, including how humans can design bat-friendly cave gates.</p>	<p>Science 5-ESS3-1 Obtain and combine information about ways individual communities use science ideas to protect the Earth’s resources and environment.</p> <p>Science K-LS1-1 Describe patterns of what plants and animals (including humans) need to survive.</p>	

CaveSim program element: Rescue Stretcher	Corresponding SD DOE Standards	Photos of past CaveSim programs
<p>We bring a cave rescue stretcher (Sked) to our programs. Students take turns getting into the stretcher. With the direct supervision of CaveSim staff, the student in the stretcher is carried through and around obstacles by fellow students, as well as passed from student to student. Students learn teamwork, communication, and leadership.</p> <p><u>Space required:</u> any indoor or outdoor setting. May be done in classrooms or even hallways.</p>	<p>Physical Education S2.E2.4-5: Combines movement concepts with skills in dynamic activities.</p> <p>Physical Education S2.E4.2a Utilizes relationship concepts in small groups.</p> <p>Physical Education S2.E4.2b Responds to teacher directed integration of relationships with objects.</p>	 <p><i>With direct supervision from CaveSim staff, a team of kids gets ready to lift and carry a friend in the stretcher.</i></p>

The value of education: As an inventor and educator, Dave encourages students to study hard, find their passion, and understand that education is very important in life. During each program, Dave uses his personal story (including getting multiple degrees from MIT) to teach students that education leads to great success and adventure.

Keynote presentation in Lake George, CO.

Labs

Standard programs (above) can be enhanced by adding our labs. Labs provide an in-depth educational experience in a specific subject, like biology or engineering. We never use kits because our goal is to teach students that engineering and science projects are accessible to them without the use of pre-prepared materials. We emphasize conservation by using post-consumer recyclable materials in our engineering labs. Labs require extra funding for materials and staff time. Contact us for pricing.

Fruit Bat Lab: Students work in small groups to design a “bat tongue” with the goal of extracting “nectar” (jellybeans) from a “flower” (plastic tube). Dry-erase markers are used to demonstrate the transfer of pollen from the flower to the pollinating bat.

Recommended time: 30-45 minutes. Recommended class size: Up to 25 students. Recommended grade level: 2nd grade and up.

Standard(s) addressed: Science 2-LS2-2 Develop a simple model that mimics the function of an animal in dispersing seeds or pollinating plants.

Helmet Engineering Lab: In our version of the classic egg-drop experiment, students design and prototype “helmets” for eggs. Working in groups, students use basic materials like straws, bags, bottles, popsicle sticks, tape, and hot glue to create an enclosure for a plastic egg

(filled with small rocks). The students test their “helmet” designs from a low height, and re-design as needed if the plastic egg cracks. Students are then given a real egg, which they insert into their design in place of the plastic egg. CaveSim staff then drop the students’ helmet designs from the top of the CaveSim tower. Students check their projects after each drop to see if their egg has survived the 12 foot fall. Students learn fundamental engineering principles, as well as the importance of perseverance.

Recommended time: 60-90 minutes. Recommended class size: Up to 25 students. Recommended grade levels: 3rd grade and up
Standard(s) addressed: Science 4-PS3-1 Use evidence to construct an explanation relating the speed of an object to the energy of that object. Science 4-PS3-3 Ask questions and predict outcomes about the changes in energy that occur when objects collide.

Flashlight Engineering Lab: Students create circuits using LEDs, switches, batteries, and other components to create an LED light system. They get hands-on experience with soldering (with supervision from CaveSim staff), and then design and make their own caving flashlight enclosure from recyclable materials. After creating their lights, students test their work in water to see if their lights are waterproof. Students have the chance to revise their designs if needed.

Subjects covered: Electromagnetics, product design, material science, and mechanical engineering.

Recommended time: 55 to 90 minutes. Recommended class size: Up to 25 students. Recommended grade levels: 5th grade and up

Above, students work on the Flashlight Engineering Lab

Biota Lab: Students culture cave biota in Petri dishes, and learn that single-celled organisms can demonstrate a form of intelligence. Students choose from multiple experiments, and discuss the factors that impact the outcome of their experiments (including how well their organisms survived).

Subjects covered: Experiment design, scientific method, and biology concepts.

Recommended lab time: 30 to 45 minutes, with a follow-up on a second day (with or without CaveSim staff present).

Recommended class size: Up to 30 students.

Recommended grade levels: 3rd grade and up.

High school students at a two-day program in Oklahoma get ready to inoculate their Petri dishes.

Karst Lab: Students make karst topography (cave landforms, specifically sinkholes) with safe household materials. Students learn hydrology, geology, chemistry, landforms, states of matter.

Recommended lab time: 30-40 minutes.

Recommended class size: Up to 30 students.

Recommended grade levels: Spring-semester 3rd grade and up.

Standard(s) addressed: Science 4-ESS3-2 Generate and compare multiple solutions to reduce the impacts of natural Earth processes on humans. Science 2-ESS2-2 Develop a model to represent the shapes and kinds of land and bodies of water in an area. Science 2-ESS2-3 Obtain information to identify where water is found on Earth and that it can be solid or liquid.

Above, 5th graders work on the Karst Lab

Formation Lab: Students make cave formations (e.g., stalactites) using safe household materials. We also do exciting demonstrations with the safe chemical sodium acetate (from reusable heat packs). Students learn hydrology, geology, basic chemistry, states of matter.

Recommended lab time: 30-40 minutes.

Recommended class size: Up to 30 students.

Recommended grade levels: 2nd grade and up.

Waves and Energy Lab: After watching a demo with real cave rescue phones, students make their own version using cups and string. Students conduct several experiments with their phones and record their observations. Students learn about waves, energy, and graphing.

Recommended lab time: 30-40 minutes.

Recommended class size: Up to 30 students.

Recommended grade levels: 1st grade and up.

Standard(s) addressed: Science 4-PS3-2 Make observations to provide evidence for how energy can be transferred from place to place by sound, light, heat, and electric currents. Science 1-PS4-4 Design and build a device that uses light or sound to solve the problem of communicating over a distance.

Geology Lab: Using small collections of rocks, students conduct geologic tests including hardness, solubility, density, and magnetism. Students record findings on a worksheet and compare results with classmates to gain an understanding of the three major rock types, geologic classification, soil formation, fossil characteristics, etc. Students learn about the many ways in which humans use rocks and minerals in our everyday lives.

Recommended lab time: 30 minutes.

Recommended class size: Up to 50 students (two simultaneous classrooms).

Recommended grade levels: 2nd grade and up.

Standard(s) addressed: Science 5-PS1-3 Make observations and measurements to identify materials based on their properties. Science 4-ESS1-1 Identify evidence from patterns in rock formations and fossils in rock layers to support an explanation for changes in a landscape over time. Science 3-LS4-1 Analyze and interpret data from fossils to provide evidence of the organisms and the environments in which they lived long ago.

States of Matter and Chemical Reactions: Students watch several safe combustion demos with carbide lamps to learn about chemical and exothermic reactions, states of matter, pressure, and other physical science concepts. Students conduct several experiments with vinegar, water, and powdered laundry detergents. Students record observations on a worksheet and compare with the class. Allergy accommodation: if students have concerns about contact with laundry soap, please let us know and we will provide Latex-free gloves for those students.

Recommended lab time: 30 minutes.

Recommended class size: Up to 50 students (two simultaneous classrooms).

Recommended grade levels: 2nd grade and up.

Standard(s) addressed: Science 2-PS1-1 Plan and carry out an investigation to describe and classify different kinds of materials by their observable properties.

Bat Science: Students learn about a disease that is killing millions of bats, but which does not hurt humans at all. Using fluorescent dye in test tubes, students role-play bats and learn about how diseases spread among animal populations. As a group, we graph the results of the game to learn about the basics of graphing. Students also get to see an exclusive interview that CaveSim staff did with a bat rehabilitation expert.

Recommended lab time: 30 minutes.

Recommended class size: Up to 25 students.

Recommended grade levels: 4th grade and up.

Standard(s) addressed: Science 3-LS4-3 Construct an argument with evidence how some organisms thrive, some struggle to survive, and some cannot survive in a particular habitat.

Cave Art: Students use charred wood and water to make a simple, safe paint. Students then use the Bernoulli principle to blow their paint onto paper with straws. Students use their hands or stencils to make art the way that prehistoric people did.

Recommended lab time: 30 minutes. Recommended class size: Up to 25 students. Recommended grade levels: 2nd and up.

Standard(s) addressed: Fine Art 1.VA.Cr.1.1 Engage in creative art-making using observation and exploration. 1.VA.Cr.2.1 Explore safe uses of materials, tools, and procedures to create works of art.

Pricing and FAQ

How much do programs cost? This depends on factors like travel distance, number of days, and number of students. Our current pricing is shown at <https://www.cavesim.com/schools/pricing/>. Please contact us for a quote.

Are deposits or contracts required? No. We will reserve your program date(s) once we agree on a price and you send us an email stating that you want us to visit your school at the agreed-upon price.

How are payments made? By check, made out to CaveSim LLC, as specified on the invoice that we'll email you. W9 available upon request.

Does CaveSim carry insurance? Yes. Once you commit to working with us, please let us know if you need a Certificate of Additionally Insured.

Are permission slips required? Yes. Paperless and printable versions in both English and Spanish are available: www.cavesim.com/waiver.

How much space is needed? Is power required? See www.cavesim.com/pages/site-logistics

Is this an outdoor activity? Typically yes. The cave stays inside the trailer (we don't move it into your school). Some activities can be moved inside in inclement weather (the tower can be moved indoors if you have 13+ foot ceilings in some part of your school). In light to moderate rain/snow, we put up tents to protect students and the cave.

Is the cave heated and air conditioned? Yes. Please provide access to 1 working 20A outlet in summer, and 2 outlets (15A and 20A) in winter.

How much setup and takedown time are needed? Typically 1.5 hours for setup, and 1 hour for takedown.

Does CaveSim do multi-day programs? Yes. We have done as many as six days in one school district.

How many students can participate in a day? For elementary, 150-200. For MS/HS, 100-150. Educational value and number of students are inversely related. We're excited about working with you to size your groups for the best possible educational experience.

Safety and special needs

Teachers/staff can explore the cave, and students with special needs (physical or otherwise) may be assisted by school staff, students, and/or CaveSim staff. While each student is different, numerous wheelchair-bound students have explored CaveSim. Some students may have more difficulty avoiding cave formations, and our only requirement is that each student understands their goal of not touching the formations (for the safety of the system and students). Students who are unable to understand the careful-caving goal may participate in our other activities. CaveSim has cameras for checking on students as they explore. We have five access points to let participants out of the trailer if needed.

We follow the [BSA's Youth Protection](#) policy, which includes no 1:1 student/adult interaction.

Challenge by Choice

Most students love exploring CaveSim. Occasionally we have a student who is unsure, uncomfortable, or afraid. We encourage him/her to set a goal for themselves and see if they can attain that goal. We teach Challenge by Choice, and have plenty of activities for students to try.

Classroom management

We've been doing our programs since 2010, and our staff includes former classroom teachers, so we have a good handle on classroom management. Because we spent over two years creating CaveSim, we set expectations at the start of the program: we expect students to respect the equipment and everyone involved in the program. We rarely experience discipline problems, but when we do we ask students to either change their behavior or take a break from the activity until they are ready to participate properly. Our goal is to work as a team with you, so please feel free to communicate with us about any issues that you foresee.
